

L2 - 15.4. Friday Overtime

Challenge Scenario : It's a Friday evening at PandaProbe Intelligence when a notification appears on your CTI platform. While most are already looking forward to the weekend, you realise you must pull overtime because SwiftSpend Finance has opened a new ticket, raising concerns about potential malware threats. The finance company, known for its meticulous security measures, stumbled upon something suspicious and wanted immediate expert analysis. As the only remaining CTI Analyst on shift at PandaProbe Intelligence, you quickly took charge of the situation, realising the gravity of a potential breach at a financial institution. The ticket contained multiple file attachments, presumed to be malware samples. With a deep breath, a focused mind, and the longing desire to go home, you began the process of:

1. Downloading the malware samples provided in the ticket, ensuring they were contained in a secure environment.
2. Running the samples through preliminary automated malware analysis tools to get a quick overview.
3. Deep diving into a manual analysis, understanding the malware's behaviour, and identifying its communication patterns.
4. Correlating findings with global threat intelligence databases to identify known signatures or behaviours.
5. Compiling a comprehensive report with mitigation and recovery steps, ensuring SwiftSpend Finance could swiftly address potential threats.

Answer the questions below

| Who shared the malware samples?

Urgent: Malicious Malware Artefacts Detected
by SwiftSpend Finance - Registered 2023-12-07T23:10:51.5503909

Dear PandaProbe Intel team,

I hope this message finds you well. My name is Oliver Bennett from the Cybersecurity Division at SwiftSpend Finance. During our recent security sweep, we have identified a set of malicious files which, based on our preliminary analysis, seem to be associated with.

Details

Date Detected: Friday, December 8, 2023

Infected Systems: Over 9000 systems

Nature of Malware: Unknown / Suspected RAT

We believe the intent of this malware is to gain a foothold to ultimately exfiltrate sensitive financial data and possibly deploy ransomware.

Immediate Actions Taken

- Isolated the infected systems from the network.
- Initiated a comprehensive scan across all systems.
- Collected and stored malware samples securely for further analysis.

- We are currently collaborating with external cybersecurity agencies and our security solutions providers to get a deeper understanding of this malware. However, we wanted to raise this with you immediately given the potential risk associated with APTs.

We strongly need your team's assistance with conducting a thorough review of the malware sample. The password to the attached archive is: Pands221/

Moving forward, we are going to conduct a User Awareness Training to inform all staff members to be extra cautious, especially when dealing with email attachments and links.

Attached are the indicators of compromise (IoCs) for your perusal. I am also available for a call or meeting to discuss our findings in detail and strategise our response.

Your prompt attention to this matter is highly appreciated. Let's work together to ensure the safety and integrity of our systems and data.

Warm regards,

Oliver Bennett

What is the SHA1 hash of the file "pRsm.dll" inside samples.zip?

9d1ecbbe8637fed0d89fca1af35ea821277ad2e8

```
[ericatracy@ip-10-114-180-173 Downloads]$ ls
cbmrpa.dll  mailffpassword.dll  pRsm.dll  qmsdp.dll  samples.zip  wcdbcrk.dll
[ericatracy@ip-10-114-180-173 Downloads]$ sha1sum pRsm.dll
9d1ecbbe8637fed0d89fca1af35ea821277ad2e8  pRsm.dll
[ericatracy@ip-10-114-180-173 Downloads]$
```

Which malware framework utilizes these DLLs as add-on modules?

MgBot

Which MITRE ATT&CK Technique is linked to using pRsm.dll in this malware framework?

T1123

<https://www.welivesecurity.com/2023/04/26/evasive-panda-apt-group-malware-updates-popular-chinese-software/>

What is the CyberChef defanged IP address of the C&C server first detected on 2020-09-14 using these modules?

122[.]10[.]90[.]12

What is the md5 hash of the spyagent family spyware hosted on the same IP targeting Android devices in Jun 2025?

951F41930489A8BFE963FCED5D8DFD79

The screenshot shows the VirusTotal interface for the IP address 122.10.90.12. It features two main sections: 'Passive DNS Replication' and 'Communicating Files'. The 'Passive DNS Replication' section displays a table with 16 entries, showing dates, detection counts (0/90), the resolver (VirusTotal), and domains. The 'Communicating Files' section displays a table with 4 entries, showing scan dates, detection counts, file types, and file names. The MD5 hash 951F41930489A8BFE963FCED5D8DFD79 is highlighted in the last row of the 'Communicating Files' table.

Passive DNS Replication (16)
